

CSS is Awesome

In this lab we'll go more complex CSS to make a side menu, footer and floats.

Side Menu

A side menu is used to navigate between differnt web pages, and they're essentially a list of links (which you already did in last week's lab). Apply some CSS to make it more fancy and modern. Like this one

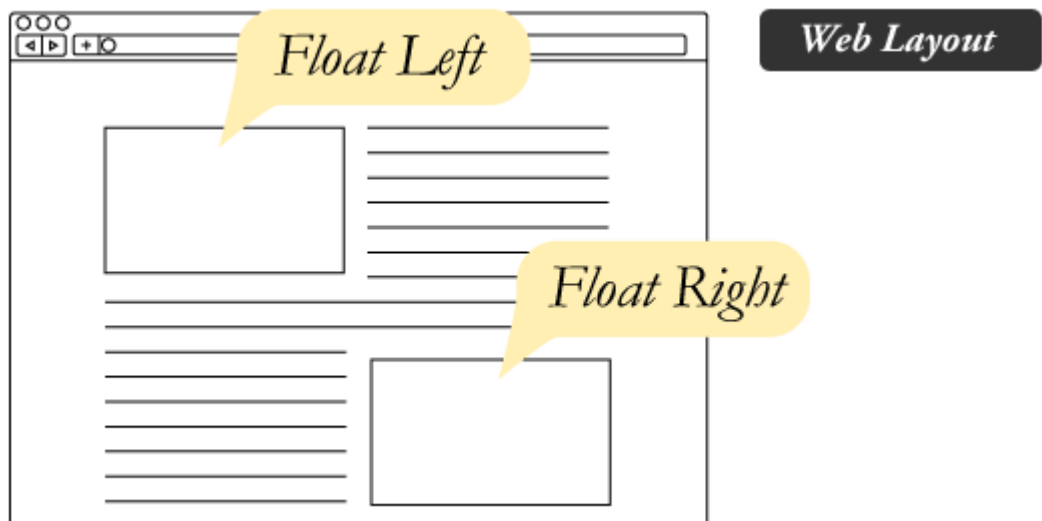

Some useful attributes you might need:

- `list-style-type: none;` to make list without the leading dots
- `display: block;` to display a block
- `background-color` to set background color
- `li a:hover {}` to set CSS for hover events

If you need help, [this article](#) may help you

Floats

Add some text or images to your HTML. Floats are used as a positioning property.

Try use `float: right;` or `float: left;` to change the position of your side bar/image. If you found something weird like the mug at the beginning, a `clear` property may help you.

Footer

Usually a footer is a fixed (still stays there even you scroll up and down) bar at the bottom of a browser window.

Create something like this

, the magic words are `position: fixed;` and `width: 100%;` . You can use `<footer>` tag for this one.

Main

In HTML5, main contents are usually put into `<main>` tag. See [this](#) article for more information.
